
Graduate Certificate in Cruise Ship Environmental Stewardship

Waste Management and Pollution Prevention

Waste Management and Pollution Prevention Glossary:

1. Ballast Water:

- Related Terms: Invasive Species, Ballast Water Treatment
- A term referring to the water carried in ships' ballast tanks to improve stability and balance. Ballast water can contain a variety of organisms, including bacteria, microbes, and marine species, which can be harmful if released into new ecosystems.

2. Bilge Water:

- Related Terms: Oil/Water Separator, Bilge Water Treatment
- Water that accumulates in the lowest part of a vessel, known as the bilge, which often contains oil, grease, and other contaminants. Proper treatment and disposal of bilge water are crucial for preventing marine pollution.

3. Black Water:

- Related Terms: Sewage Treatment, Marine Sanitation Device
- Wastewater generated from toilets on ships, which contains human waste and can harbor pathogens and pollutants. Black water must be treated before discharge to protect marine environments and public health.

4. Emission Control Area (ECA):

- Related Terms: Sulfur Oxides, Nitrogen Oxides
- Designated maritime areas where strict regulations govern emissions from ships to reduce air pollution. Emission Control Areas typically impose limits on sulfur and nitrogen oxides emissions, requiring vessels to use cleaner fuels or emission control technologies.

5. Grey Water:

- Related Terms: Wastewater Treatment, Grey Water Recycling
- Water generated from sources such as sinks, showers, and laundry facilities on board ships, which may contain detergents, oils, and other contaminants. Grey water can be treated and reused for non-potable purposes to reduce water consumption and wastewater disposal.

6. Hazardous Waste:

- Related Terms: Hazardous Materials, Waste Segregation
- Waste materials that possess properties that make them potentially harmful to human health or the

environment. Hazardous waste must be properly identified, stored, transported, and disposed of in accordance with regulations to prevent pollution and minimize risks.

7. Incineration:

- Related Terms: Waste to Energy, Incinerator
- The controlled burning of waste materials at high temperatures to reduce the volume of waste and generate energy. Incineration can be used to dispose of certain types of waste on ships, but it must be carefully managed to prevent air pollution and ensure compliance with regulations.

8. Marine Pollution:

- Related Terms: Oil Spill, Plastic Pollution
- The introduction of harmful substances or contaminants into the marine environment, resulting from human activities such as shipping, fishing, and industrial processes. Marine pollution can have severe impacts on marine ecosystems, wildlife, and human health.

9. Oil/Water Separator:

- Related Terms: Bilge Water, Pollution Control Equipment
- A device used to separate oil and other contaminants from water, typically installed on ships to treat oily bilge water before discharge. Oil/water separators help prevent oil spills and reduce pollution in marine environments.

10. Pollution Prevention:

- Related Terms: Source Reduction, Best Management Practices
- The practice of reducing or eliminating the generation of waste and pollutants at the source to minimize environmental impact. Pollution prevention focuses on preventing pollution before it occurs, through strategies such as waste reduction, recycling, and process improvements.

11. Recycling:

- Related Terms: Circular Economy, Waste Management Hierarchy
- The process of collecting, sorting, processing, and reusing materials to create new products or materials. Recycling helps conserve natural resources, reduce energy consumption, and minimize waste generation, making it an essential component of sustainable waste management.

12. Sewage Treatment Plant:

- Related Terms: Black Water, Grey Water, Advanced Wastewater Treatment
- A facility designed to treat wastewater from ships, including sewage, to remove contaminants and pathogens before discharge. Sewage treatment plants play a critical role in preventing water pollution and protecting marine ecosystems.

13. Solid Waste Management:

- Related Terms: Waste Sorting, Landfill, Waste Minimization

- The systematic control, collection, handling, and disposal of solid waste generated on ships. Solid waste management involves practices such as waste segregation, recycling, and waste minimization to reduce the environmental impact of waste disposal.

14. Source Reduction:

- Related Terms: Preventive Measures, Waste Reduction
- The practice of minimizing waste generation by reducing the amount or toxicity of materials used in production processes. Source reduction aims to prevent waste before it is created, through measures such as product redesign, process optimization, and material substitution.

15. Special Areas:

- Related Terms: MARPOL Annex I, MARPOL Annex V
- Designated maritime regions where specific environmental regulations apply to protect sensitive ecosystems or species. Special Areas may include restrictions on discharges, emissions, and waste disposal to preserve the ecological integrity of the area.

16. Waste Management:

- Related Terms: Waste Segregation, Waste Disposal, Recycling
- The systematic control, collection, handling, treatment, and disposal of waste materials in an environmentally responsible manner. Waste management encompasses practices to minimize waste generation, promote recycling, and ensure compliance with regulations.

17. Waste Minimization:

- Related Terms: Resource Conservation, Waste Reduction
- The practice of reducing the amount of waste generated by preventing waste at the source or optimizing processes. Waste minimization aims to conserve resources, reduce environmental impact, and improve efficiency in waste management practices.

18. Waste Segregation:

- Related Terms: Source Separation, Recycling
- The process of separating different types of waste materials for proper handling, treatment, and disposal. Waste segregation helps facilitate recycling, reduce contamination, and ensure compliance with regulations governing waste management practices.

19. Waste-to-Energy:

- Related Terms: Incineration, Energy Recovery
- The conversion of waste materials into usable energy, such as electricity or heat, through processes like incineration or gasification. Waste-to-energy technologies can help reduce waste volume, generate renewable energy, and minimize environmental impact.

20. Zero Discharge:

-
- Related Terms: Pollution Prevention, Closed-Loop Systems
 - A waste management approach that aims to eliminate all discharges of waste materials or pollutants into the environment. Zero discharge systems often rely on recycling, treatment, and closed-loop processes to minimize environmental impact and resource consumption.
